

Software Developer Intern

₹5,000 – ₹10,000 • No equity

About the job

Software Developer Intern (Full-Stack)

Stipend: ₹5,000–₹10,000 • No equity

Type: Internship (full-time preferred; part-time considered)

Introduction

Build real products end-to-end with a small, fast team shipping across web, native, and backend services. You'll design and implement features, wire up clean UIs, integrate APIs, and help shape our architecture and dev practices. Expect hands-on work with Google APIs (Maps/Places/Geocoding), auth (Google + email/password), multi-language support (i18n), analytics/AdSense, and real-time, location-aware experiences.

What You'll Do

Ship features end-to-end: React/Next.js front-end + Python/Node back-end, integrating REST/GraphQL services.

Own UI/UX flow: Build responsive UIs with React + Tailwind; optimize for performance and accessibility.

Integrate external services: Google Maps/Places/Geocoding, auth, payments/monetization, and analytics.

APIs & data: Design, consume, and document REST/GraphQL endpoints; model data in PostgreSQL.

Quality & performance: Instrument metrics, profiling, and monitoring; identify bottlenecks and fix them.

Dev excellence: Contribute to code reviews, testing, CI basics, and incremental architecture improvements.

AI in the loop: Use AI dev tools (prompting, code/gen test scaffolds, linting, refactor assistants) to move faster.

Stack You'll Touch

Front-end: TypeScript, JavaScript, React, Next.js, Tailwind CSS

Back-end: Python (FastAPI/Flask), Node.js (optional), GraphQL (Apollo), REST

Data: PostgreSQL (SQL, schema design, migrations)

APIs/Integrations: Google Maps/Places/Geocoding, OAuth/Email auth, AdSense/Analytics

Tooling: Git, GitHub, Jira, Postman/Insomnia, testing frameworks (Jest/PyTest)

AI Dev Tools: Code assistants, unit-test generators, lint/format bots, prompt workflows

Responsibilities

Build performant, accessible front-end views and components in React/Next.js.

Implement and document API endpoints; write clean, testable Python/TypeScript code.

Connect front-end to back-end (REST/GraphQL) and manage app state (Apollo/React Query).

Design efficient SQL schemas/queries in PostgreSQL; handle migrations and seed data.

Add telemetry: logging, basic tracing/metrics, and performance profiling.

Participate in PRs, stand-ups, and sprint rituals; write short design notes/READMEs.

Requirements (Must-Have)

Strong interest in front-end and back-end development (full-stack mindset).

Proficiency in TypeScript/JavaScript and comfort with React + Next.js.

Working knowledge of Python for back-end services.

Familiarity with GraphQL (Apollo) and REST fundamentals (THIS IS A MUST).

Basic PostgreSQL skills (tables, joins, indexes) and writing SQL.

Comfort with Git workflows and task tracking (e.g., Jira).

Evidence of building meaningful software (projects, coursework, OSS, or freelance).

Clear written and verbal communication; collaborative in a fast-paced environment.

Nice-to-Have

FastAPI/Flask, React Query, Zod, WebSockets.

Auth (OAuth, JWT), i18n, file uploads, caching.

CI basics (GitHub Actions), container basics (Docker), cloud basics (AWS/Hetzner).

Testing (Jest/RTL, PyTest), accessibility (a11y) and Lighthouse performance tuning.

Experience with Google Maps/Places/Geocoding or other location services.

Education

Actively pursuing a Bachelor's/Master's/PhD in CS/SE/CE/EE or a strong self-taught portfolio.

What You'll Get

Real ownership on user-facing features and platform components.

Mentorship: Paired with an engineer; frequent code reviews and design feedback.

Learning velocity: Constant exposure to new tools, AI workflows, and product thinking.

Access: Work closely with engineering, product, and the founding team.

Culture: High-trust, collaborative, and bias-to-ship. Diversity and inclusion are core values.
